UNFPA United Nations Population Fund

The evaluation of the regional and district logistics management training presented in this report was conducted by the following evaluation teams:

Team A: Morogoro and Dodoma Regions

Mr. Jeremiah Kirway, Logistics Trainer, Institute of Development Management, Mzumbe

Mr. Mohammed Irema, Tanzania AIDS Project, AIDSCAP

Mr. Daniel Thompson, Training Advisor, FPLM Project, JSI

Team B: Iringa and Mbeya Regions

Mr. Daniel Mmari, Logistics Officer, Family Planning Unit, Ministry of Health

Mr. Alto Simime, Logistics Trainer, Institute of Development Management, Mzumbe

Ms. Barbara Felling, Training Advisor, FPLM Project, JSI

The consultants would like to thank the other members of the evaluation teams for their tireless efforts in conducting interviews, reviewing records, and counting contraceptives, and for their expertise and patience in providing on-the-job training to NFPP and NACP personnel.

I. SUMMARY AND RECOMMENDATIONS

FPLM Training Advisors Barbara Felling and Daniel Thompson visited Tanzania from May 22 to June 9, 1995 to undertake an evaluation of the regional and district level logistics management training which was initiated in September 1994 as part of the Logistics System Improvement Project. Specifically the scope of work for the visit was to:

- 1. Conduct a training impact evaluation of logistics management training in Dodoma, Morogoro, Mbeya, and Iringa Regions.
- Analyze and disseminate the findings from the evaluation to USAID/Tanzania, the Family Planning Unit, UNFPA, IDM and USAID/Washington.
- Present recommendations based on evaluation findings.

In addition to the above, the FPLM Training Advisors

- 4. Oriented the IDM Logistics Training Team to the newly revised logistics training curriculum and job reference manual.
- Provided NFPP and NACP staff who were interviewed during the evaluation with a job reference manual and on-the-job training as needed.
- 6. Interviewed 4 of the 6 members of the IDM Logistics Training Team and FPU and NACP central level staff to gather their observations about the implementation of the logistics training activities and the improved logistics system.

The training evaluation team would like to thank all those NFPP and NACP staff who participated in the evaluation interviews and who are trying under varying circumstances to implement the logistics system.

The following recommendations are made based on the findings of the training evaluation. A full discussion of the findings can be found in Section III below. As this evaluation is the first component of a two-part evaluation of the impact of logistics assistance to improve the Tanzania family planning and AIDS control logistics systems, further recommendations will be presented after the findings of the second component are analyzed and available in early August. The recommendations presented here are divided into two categories, those related specifically to training, and those not directly

related to the training of NFPP and NACP personnel.

Training Recommendations

1. FPLM and IDM should strengthen components of the logistics training curriculum. The training evaluation identified several areas in the curriculum that are weak.

The changes that should be made to the curriculum fall into three categories: "content to strengthen," which are curriculum areas that are currently covered in the curriculum, but in insufficient detail for participants to gain competence in the procedure; "content to emphasize," which are those content areas which may be covered sufficiently, but which do not receive enough emphasis to convey the importance of the procedure; and "content to delete," which are content areas that are currently in the curriculum, but which have been identified as unnecessary for the efficient operation of the logistics system, and may confuse participants. The components which should be revised or deleted are:

Content to Strengthen:

- how to organize data for calculating average monthly consumption rate
- what procedures to take if data for calculating average monthly consumption are incomplete or do not cover a 6 month time period

Content to Emphasize:

- what is and how to place an emergency order
- conducting routine physical inventories
- reporting and ordering procedures, including clarifying the standard reporting periods, noting all adjustments (not only losses) on reporting forms, and recording orders on the Inventory Record

Content to Delete:

the interpretation of trends to determine if a 6 month or 3 month average should be used to calculate the average monthly consumption rate. A 6 month average should always be used.

Attention should also be paid as to how certain mathematical symbols, equations, and word representations are interpreted by participants during training, and where necessary, trainers should paraphrase and check for participant understanding.

For example, respondents in the evaluation could understand the following equation as meaning 200 divided by 50 equals 4:

$$200 \div 5 = 4$$

However, when presented with the following equation,

Balance on Hand \div AMCR = Months of supply

they did not always equate the same relationship of division when words were used instead of numbers.

2. The Family Planning Unit should better coordinate the schedule for regional logistics training with other training provided by the Ministry of Health to avoid conflicts for NFPP personnel attending logistics training.

As reported by the IDM Training Teams, there have been a number of occasions when the trainers have either been unable to carry out the needs assessment activity with NFPP personnel, or when NFPP personnel are not available to attend logistics training in their region, because they are participating in other MOH training activities.

3. When identifying participants for regional training, the IDM Training Team should be sure that the personnel to be trained will be in their positions for at least one year following training in order to implement the system.

In the last six months since receiving the logistics training, two persons trained had retired and two had been transferred into positions not responsible for logistics. While protocol may dictate that soon-to-retire staff receive training, training the in-coming or assistant will help to assure that there is not interruption in the implementation of the logistics system. In cases where personnel will be retiring in the near future, the assistant or in-coming person should be included in the logistics training.

4. The District Cold Chain Operator (DCCO) should be included in logistics training in those districts where the DCCO works closely with NFPP personnel to deliver contraceptives and provide supervision to the SDPs.

During the evaluation it became clear that in some cases the DCCO plays a significant role in the implementation of the family planning logistics system. In

these districts, the DCCO may not only deliver the contraceptives, but may also determine the quantity to issue and help SDP staff complete the report. In those cases, the DCCO should be included as a participant in the training so that they will know the proper procedures for implementing their *de facto* logistics responsibilities.

5. The IDM Logistics Trainers and FPU central staff should reinforce with district NFPP staff the use of opportunities to provide logistics training to SDP personnel.

The evaluation found that most of the district MCH coordinators are unable to visit all their SDPs each month. SDP personnel may send in their order or come to the district to collect their supplies after completing their report. This makes it very important that SDP personnel learn their logistics responsibilities as early as possible. SDP personnel learn about the logistics system during supervisory visits and to a smaller degree during HMIS training. However, if supervisory visits are intermittent, any opportunity to train SDP personnel at other times should be used. This opportunity may be when SDP personnel come to the district to collect their paychecks or supplies. This procedure is currently being used in Iringa Rural (North & South Districts).

6. To support the training of SDP personnel, the FPU should develop simple SDP level job aids and accompanying curriculum for use by district MCH coordinators in training SDP personnel.

In the same way that regional and district level staff have a job reference manual, the SDP level should have simple job aids in Kiswahili to refer to when completing their records and reports and organizing their contraceptive storage areas. The job aids could be in the form of laminated reference cards with step-by-step procedures. This would be particularly helpful to SDP personnel who may only perform logistics tasks once a month and therefore need not commit the procedures to memory. To complement the job aids, a SDP level logistics curriculum should be developed in a modular format for district level staff to use during on-the-job or short, formal training sessions, or during meetings. FPLM is available to provide assistance in the development of job aids and curriculum as required. We suggest that IDM also assist in the development of the job aids and curriculum, and that the IDM Logistics Training Team be used to introduce them to district coordinators.

7. Regional Medical Officers (RMOs) should be given an orientation to the NFPP and NACP logistics systems during their next annual meeting.

While the RMOs have no direct responsibility in implementing the logistics system, they do have influence in reinforcing the importance of using logistics procedures with program personnel who implement the system. The FPU should request that the IDM Training Team design and conduct such an orientation. The orientation should not be a training course, but should be a carefully designed presentation with objectives that instill the importance of and an interest in the effective implementation of the system. If requested, FPLM would be available to assist IDM with the development of the orientation presentation.

8. Regional Nursing Officers (RNOs) should receive training in the NFPP logistics system.

While some RNOs have been included in the regional logistics training workshops that have been already been conducted, in some regions they have not been invited to attend. From the evaluation it seems evident that RNOs have a role in follow-up and supervision of district level staff, and therefore should be knowledgeable about the system in order to provide on-the-job training when necessary. As well, in one of the regions visited during the evaluation, the RNO was actually managing the contraceptive supplies and therefore needed the information from the training to fulfill her responsibilities. RNOs should be included as participants in all future regional logistics workshops, or could participate in a separate logistics training workshop.

9. Regional MCH Coordinators and RACCs should receive a follow-up visit from the central level soon after they have received logistics training to reinforce the procedures learned, to assure that the logistics system is implemented immediately after the training, and to emphasize the importance of regional level supervision to the district level. Support in the form of funds and/or transportation should be given to facilitate these follow-up visits.

During the evaluation visits to the regions it was noted that some participants did not immediately put into action what they learned upon returning to their workplaces. In some cases, they faced unexpected obstacles to implementation of the system, in others they simple went back to the same procedures they used before the training. It is essential that the central level send a message, preferably through follow-up visits, about the importance of the logistics system and its immediate implementation at the regional and district levels. During these visits, central level personnel can help regional personnel to overcome any problems they have in implementing the system and stress the role the region must play in operationalizing the system at the district level.

10. The Family Planning Unit and NACP should request that IDM establish an annual or semi-annual course in family planning and AIDS control logistics management within IDM so that personnel who move into positions that include logistics management responsibilities after the completion of the 20 regional trainings can receive training.

Movement and turn-over of NFPP and NACP staff is inevitable, and therefore it is likely that in the future there will be personnel who find themselves in the position of managing contraceptive and AIDS control supplies without having the training to adequately do so. Since it is expected that staff needing logistics training will be few in number at any one time and located throughout the country, the most efficient mechanism for providing this training would be to conduct logistics training workshops for regional and district staff once or twice a year. As the capability of providing training in the NFPP and NACP logistics systems is now institutionalized within the IDM Logistics Training Team, IDM should be requested to include this training in its regular short course offerings.

To remain effective, it will be necessary for the IDM Logistics Training Team to be informed of any changes made to the logistics systems so that they may learn the changes and adapt the curriculum as necessary. It should also be noted that the institutionalization of this specific logistics training rests with the members of the IDM Logistics Training Team who themselves have received significant training. Should the composition of the training team change, the quality of the logistics training offered should be evaluated.

11. The Family Planning Unit should explore where logistics training could be included in other training provided to NFPP staff, particularly pre-service training.

As all NFPP staff have some responsibility for the management of contraceptive supplies, one effective means of providing new staff with logistics training is to include a module on logistics procedures in the pre-service training curriculum. While it may be difficult to include the current 5-day training workshop into the pre-service course, it may be possible to distill the logistics content into a one or two day module that may more easily fit into the context of a longer course. If requested, FPLM would be able to assist in the adaptation of the curriculum for pre-service training.

In addition to pre-service training, it would also be helpful to continue to reinforce logistics procedures during formal in-service training and professional meetings.

Non-Training Recommendations

NFPP

12. The role of the FPU MIS Officer as it relates to the monitoring of logistics training activities should be more specifically defined to make the best use of time and FPU resources.

The FPU MIS Officer is currently spending much of his time accompanying the IDM Logistics Training Team on their training needs assessment visits. Each of these training needs assessment activities is 4 to 5 weeks in duration. This time would be better spent managing the Tanzanian Government's investment in training, assuring that IDM is following the terms of its contract, reviewing reports of the training activities and disseminating information to FPU and interested donors, coordinating the scheduling of training with other Ministry of Health initiatives, and finding mechanisms to support and supervise those regional and district level personnel who have already received logistics training. The FPU should continue to be represented at the one week regional workshops as resources to the IDM trainers. The MIS Officer, or others familiar with the logistics system, should provide this representation.

13. The Family Planing Unit should consider printing and controlling the government issue voucher for use in tracking contraceptive distribution transactions between program levels.

From the evaluation, it was noted that very few NFPP personnel are using issue vouchers to document the movement of contraceptives. The issue vouchers that were intended to be used by the program are the government issue vouchers currently printed by branches of the local governments in the regions. Unfortunately, when NFPP staff at the regional and district levels request issue vouchers, more often than not, the local government agency responsible does not have any available. If they are available, they are in short supply forcing NFPP staff to use issue vouchers erratically and sparingly. In some cases one voucher is used to account for multiple shipments.

In order to fully account for contraceptives, transaction records such as issue vouchers are used to verify essential information about contraceptive movement. Without issue vouchers, it is difficult to track the issue or receipt of contraceptives. By printing issue vouchers and making them available for use by the NFPP, FPU can account for the movement of its contraceptives, determine lead times, and pinpoint possible discrepancies in stock records.

As with the reporting forms, each issue voucher should be printed in triplicate, each a different color, on carbonless duplicating paper. The vouchers should be distributed at the remaining regional workshops and sent with contraceptive shipments to those regions which have already received training.

NACP

13. The NACP Report & Request for Supplies form should be printed and issued immediately, along with the condom supplies, so that NACP personnel can begin using reporting and ordering procedures.

This recommendation has been made in the last three consultant reports and continues to be important. While progress has been made in printing the form, it is still not available to the regional and district level NACP personnel. Without the appropriate form for reporting and ordering, NACP staff are not able to and are not motivated to initiate reporting and ordering procedures learned during training. In a few exceptional cases seen during the evaluation, NACP personnel who had condoms to manage had photocopied the report form handout from the training, or stenciled their own version of the report form, and were implementing the reporting procedures as taught. Therefore, the consultants believe that NACP personnel are not resistance to implementing the logistics procedures, but only hindered by the lack of condom supply and the lack of reporting forms.

14. NACP should prepare a logistics management job reference manual for regional and district level staff, similar to that developed by the Family Planning Unit for NFPP personnel.

As with the NFPP manual, the NACP Job Reference Manual, which would describe logistics responsibilities and procedures for each program level, would be used during the training workshop as a reference text and would serve to reinforce the training back on the job. FPLM assisted the FPU in preparing their manual and could be requested to assist in the preparation of the NACP manual. At present, each NACP staff person attending logistics training receives a copy of the NFPP Job Reference Manual to use as many of the logistics procedures are similar, though not the same, for the two programs.

II. BACKGROUND

This is the seventh FPLM technical assistance visit of the Tanzania Logistics Management Project conducted under the USAID/Tanzania Mission buy-in. Accomplishments to date include the following.

- 1. FPLM assisted the FPU to identify and train a local logistics training team. The Institute for Development Management (Mzumbe) was contracted by the FPU, with UNFPA support, in April 1994 to conduct regional logistics training. The IDM Logistics Management Training Team has received Training of Trainers and Curriculum Development training conducted by FPLM.
- 2. FPLM assisted UNFPA to develop project documents for the funding of regional logistics training and the IDM contract.
- 3. In April 1994, FPLM trained central level staff from FPU, NACP, UNFPA, USAID, and UMATI, and the IDM Training Team in contraceptive logistics management. The workshop was also used to design components of the contraceptive logistics system.
- 4. FPLM assisted IDM with the development of a training curriculum and support materials for the training of regional and district level family planning and AIDS control personnel.
- 5. FPLM, IDM and FPU initiated the regional logistics training with a training needs assessment and pilot workshop in Dodoma Region. At the time of this report, the IDM Logistics Management Training Team has conducted 7 additional regional workshops.
- 6. FPLM observed the conduct of regional training activities and provided on-the-job training for the IDM Logistics Trainers. The curriculum has been revised and updated as a result of these observations.
- 7. Working with the FPU and IDM Logistics Training Team, FPLM developed the Job Reference Manual for regional and district NFPP personnel.

The final activity under the USAID/Tanzania buy-in to the FPLM Project is the evaluation of the logistics management training activities and logistics system improvement interventions implemented over the last three years. The purpose of this visit was to conduct the evaluation of logistics management training activities. The

evaluation of logistics system improvement interventions will be conducted in July and August.

III. ACTIVITIES

The evaluation of regional and district level logistics training was conducted in the first 4 regions to receive logistics management training - Dodoma, Morogoro, Mbeya and Iringa. Training in Dodoma was conducted by the IDM Logistics Training Team and FPLM Trainers in September 1994. Training in the other regions was conducted by IDM Logistics Trainers in November 1994. Sufficient time has passed to allow each region to have placed at least 1, if not 2, quarterly supply orders using the Report & Request for Contraceptives/Supplies form following the ordering guidelines introduced in the training.

The objectives of the training evaluation were:

- 1. to assess the knowledge and current practices of regional and district NFPP & NACP personnel who have received logistics training
- 2. to assess the effectiveness of the NFPP personnel in teaching SDP personnel how to carry out their logistics responsibilities
- 3. to identify areas of the curriculum that could be strengthened as a result of the evaluation findings.

A copy of the evaluation strategy is included in Annex B.

The evaluation was carried out over a two week period by the following two teams:

Team A: Morogoro and Dodoma Regions

Mr. Jeremiah Kirway, Logistics Trainer, IDM/Mzumbe

Mr. Mohammed Irema, Tanzania AIDS Project, AIDSCAP

Mr. Daniel Thompson, Training Advisor, FPLM Project, JSI

Team B: Iringa and Mbeya Regions

Mr. Daniel Mmari, Logistics Officer, FPU, Ministry of Health

Mr. Alto Simime, Logistics Trainer, IDM/Mzumbe

Ms. Barbara Felling, Training Advisor, FPLM Project, JSI

Representatives from USAID, UNFPA and NACP were invited to participate as members of the evaluation team, but unfortunately no one was able to participate.

In conducting the evaluation, regional, district and SDP level NFPP personnel and regional and district level NACP personnel were interviewed using a standardized questionnaire which assessed *knowledge* and asked about *practice* of logistics procedures. The questionnaire was also used to record interviewer observations about records, reports, and storage conditions. In addition to answering questions, respondents were asked to complete two exercises, one calculating months of supply, the other calculating quantity to order. The persons interviewed are listed in Annex C; the questionnaire used is included as Annex D.

A total of sixty-six interviews were conducted in the four regions. The interviews were conducted at the job sites and in most cases personnel were notified of the interview one to two days in advance. The breakdown of the respondents by level and program is as follows:

	National Family Planning Programme (NFPP)			National AIDS Control Programme (NACP)		
	Region	District	SDP	Region	District	Total
Iringa	2	7	5	1	5	20
Mbeya	2	6	5	1	5	19
Dodoma	2	6	4	0	4	16
Morogoro	. 2	5	2	1	1	11
Total	8	24	16	3	15	66

Fifty of a potential 72 training participants from the four regions were interviewed, representing a sample of 69%. The sample exceeded the expectations of the evaluation team given the distances to reach most respondents. The other 16 respondents were SDP personnel who have not received formal logistics training, but who may have received on-the-job training from trained district level personnel or who may have participated in the Health Management Information Systems (HMIS) training which introduces the records for collecting logistics data. An attempt was made to interview other past participants, but for the following reasons it was not possible:

- 2 had retired from their positions
- 2 had been transferred to other non-logistics related positions
- 2 missed appointments made to conduct the interview
- 2 were away from posts attending training
- 12 were not interviewed due to time constraints or inaccessibility.

The fact that two participants had retired from their positions and two had been transferred from their posts within 6 months of receiving training points out the need to more carefully select participants to be trained.

Central level FPU and NACP personnel and the IDM Training Team were interviewed to determine the effectiveness of the management of the training process and of the training strategy in general. The questionnaire used in interviewing central level staff can be found in Annex E.

The evaluation teams also completed a Stock & Reporting Frequency Questionnaire to gather information on the frequency of stockouts by brand of contraceptive and the consistency of reporting since the beginning of 1995. As indicators of the functioning of the logistics system, this information will be used as part of the evaluation of logistics improvement interventions. The questionnaire and results can be found as Annexes F, G, and H.

IV. FINDINGS

In general, the evaluation team found an emerging logistics system in place, and expects that over time, the system will improve as procedures are practiced more frequently. Most personnel are maintaining more than adequate logistics records and are beginning to implement reporting procedures. Storage conditions have improved greatly from those observed during the needs assessment visits, and personnel are placing a greater importance on the management of contraceptives and condoms as part of their job responsibilities.

Based on the results of the evaluation and their observations during the field visits, the consultants feel that the IDM Logistics Management Training Team is doing a good job in conducting the regional logistics workshops, and that with revisions to the curriculum as recommended above, the training workshops will be even more effective.

An annotated summary of the results of the evaluation questionnaires can be found in Annex I. Comments on findings as they relate to the objectives of the training evaluation and the objectives of the regional workshops are presented below. As no formal standardized logistics procedures were in place before the training in each region, the baseline was no knowledge or practice of logistics prior to training.

Evaluation Objective 1:

To assess the knowledge and current practices of regional and district NFPP & NACP personnel who have received logistics training.

To assess the knowledge and current practices of NFPP and NACP personnel, 32 NFPP and 18 NACP regional and district coordinators were interviewed. Their records, reports, and storage conditions were observed and evaluated. The purpose of the interview questions and observations was to determine how well personnel were undertaking their logistics responsibilities based on the objectives of the regional workshops they attended. The objectives of the regional workshops are that, by the end of the workshop, regional and district-level personnel in the NFPP and NACP will be able to:

- 1. Describe the Tanzanian family planning and AIDS control logistics systems.
- 2. Identify their individual responsibilities in the Tanzanian family planning and AIDS control logistics systems and describe them in relation to the logistics responsibilities of others.
- 3. Complete all logistics records and reports accurately and submit them to the appropriate places in a timely manner.
- 4. Assess contraceptive supply status at the regional, district and service delivery point (SDP) levels.
- 5. Determine contraceptive and condom order quantities for the regional, district and SDP levels.
- 6. Store contraceptives and condoms according to guidelines and monitor contraceptives and condoms stored at Pharmaceutical Stores and other facilities.
- 7. Monitor logistics activities on a regular basis.
- 8. Provide regular logistics supervision and immediate on-the-job training as required.

The results of the evaluation based on these objectives are described below by program.

National Family Planning Program

Most of the Regional and District MCH Coordinators interviewed could accurately describe the Tanzania contraceptive logistics system and knew the order interval for their level in the system. In addition, all but one was completing the Inventory Record with a significant degree of accuracy.

NFPP Regional & District Record Keeping

97% of regional & district facilities were maintaining Inventory Records with 92% accuracy.

47% of facilities are using Issue Vouchers.

However, fewer than half of the facilities visited were using issue vouchers. Those who did not said that they were not able to obtain the vouchers from local authorities. Many of those using issue vouchers were doing so in a way to conserve them, often not sending copies with shipments, but waiting until enough shipments had been sent to the recipient to fill all the lines on the form and then sending a copy to the recipient. In most cases, only original book copies of the voucher were observed as return copies had not been received. There was not documentation of the complete transaction.

NFPP Reporting & Ordering

Report & Request for Contraceptives forms were available for examination in 94% of facilities visited.

87% of facilities had submitted at least one Report & Request for Contraceptives in the last 6 months.

Most facilities visited had completed between 1 and 6 Report & Request for Contraceptives forms in the six months since receiving training. While the stock information on the reports was fairly complete, respondents had problems with accurately completing the "losses", "quantity needed" and "dispensed to client" columns. While able to actually record losses, several respondents were unclear how to account for a positive adjustment on the form. This is a training problem that should be corrected in the curriculum and a problem with the form which should read "losses/adjustments" as the column label.

Respondents were unclear as to how to calculate quantity needed when they had incomplete data from lower level facilities and whether to put anything in the dispensed to user column if they did not have all the data from lower level facilities. In many cases, respondents had not submitted reports because they were waiting to get the remaining data.

During the interviews the evaluators instructed respondents on using the losses column for negative and positive adjustments and asked them to submit their reports on time,

but to note the number of lower level facilities included and the total number of facilities that should have been included on the report.

NFPP Assessing Supply Status & Calculating Orders

78% of respondents could tell interviewers how to calculate AMCR

50% could calculate months of supply on hand

63% could calculate the quantity to order

NFPP Regional and District MCH Coordinators were asked to complete two exercises during the interview that involved calculating months of supply on hand and the quantity to order when given the data to do so. Given that most respondents had not been doing either of these functions on a regular basis since the training, the results above are not surprising. As noted in the recommendations, the curriculum needs to be revised to instruct participants on how to make these calculations when they have incomplete data and to encourage them to report regularly even if they do not have all the expected data.

NFPP Supervisory Visits

Only 33% of district MCH Coordinators state that they can visit all their SDPs monthly.

58% of district MCH Coordinators had not received a supervisory visit from their regional supervisor in the last six months.

In order for the Tanzania contraceptive logistics system to work with its current inventory control system, it is essential that District MCH Coordinators visit all the SDPs in their districts monthly. The evaluation team found that only 33% of district personnel say that they can visit all the SDPs monthly; 42% say they can visit not all, but more than half each month; 13% say they can visit half; and 8% can visit less than half of their SDPs in a month. Some of the constraints to visiting monthly included:

- a lack of dedicated transport for MCH at the district level
- too many SDPs located too far apart
- demands of other job responsibilities.

National AIDS Control Program

Three Regional AIDS Control Coordinators (RACCs) and 15 District AIDS Control Coordinators (DACCs) were interviewed for this evaluation. While the NACP is in the initial stages of implementing a condom logistics system, the opportunity was taken to train NACP personnel during the training of NFPP personnel in logistics. In many ways, the systems are comparable.

During the evaluation visits, it was discovered that there were condom stockouts at the regional level in two of the four regions and in at least 6 districts, and significant shortages in many more districts. In several cases NACP personnel interviewed were not able to practice what they learned in training because they had no stock to manage or knew that their requests for condoms would not be filled because the upper level facility had no stocks. While the shortage or lack of condom supply may have effected the findings of the evaluation, it is worthwhile to note that the evaluators were encouraged by the dedication, motivation and ingenuity of many of the RACCs and DACCs interviewed to do their jobs while facing numerous constraints.

NACP Regional & District Record Keeping

89% of regional & district facilities were maintaining Inventory Records with 78% accuracy.

28% of facilities are using Issue Vouchers.

Most RACCs and DACCs were able to describe the Tanzania condom logistics system and two thirds of those interviewed knew the order interval for their level in the system. Sixteen of the 18 respondents were completing inventory records. In cases of stockouts, the last entry had been made at the time of stockout, which in some cases was several months earlier. As with the NFPP, very few respondents were using issue vouchers and for the same reason - unable to obtain them from local authorities. However, in a few cases, personnel were actually making their own handwritten vouchers to use.

NACP Reporting & Ordering

Report & Request for Supplies forms were not available in any facility.

However, 39% of facilities visited had made their own and were using the report.

44% of facilities visited had never submitted a report form.

At the time of the evaluation, NACP had not yet printed or distributed the Report & Request for Supplies form. Therefore, most personnel had not been able to complete or submit them to the higher level. However, in 7 of the 18 facilities visited, RACCs and DACCs had either photocopied the sample form given to them in the training or stenciled their own copies and were completing and submitting the report. The reports examined were fairly accurate, with problems noted in recording losses and adjustments as seen in the NFPP interviews.

NACP Assessing Supply Status & Calculating Orders

72% of respondents could tell interviewers how to calculate AMCR

61% could calculate months of supply on hand

33% could calculate the quantity to order

The fairly low percentages here may be attributed to the infrequency with which personnel are doing these calculations. In cases where there were no stocks, the months of supply on hand was obvious. And in other cases, DACCs had not bothered calculating orders, since previous orders had gone unfilled and no stocks were available at the regional level. The same problems of uncertainty in using incomplete data were seen at the regional level.

NACP Supervisory Visits

33% of District AIDS Control Coordinators had not received a supervisory visit from their regional supervisor in the last six months.

It seems that in those areas where there were condom supplies, NACP personnel were motivated to practice the logistics procedures they learned during the training. However, unless NACP distributes the Report & Request for Supplies forms and condoms soon, NACP personnel will lose what they learned during the regional workshops and the motivation to use the knowledge and skills gained.

Evaluation Objective 2:

To assess the effectiveness of the NFPP personnel in teaching SDP personnel how to carry out their logistics responsibilities

This objective was accomplished by interviewing 16 SDP personnel and observing their records, reports, and contraceptive storage to assess their current logistics knowledge and practice. District level NFPP staff are responsible for supervising SDP staff and providing them with on-the-job training in logistics. The level of knowledge and practice of SDP staff reflects the effectiveness of the supervision and on-the-job training provided by the district staff.

As stated in the curriculum of the regional workshops, district level staff learned that:

"In matters related to family planning contraceptive logistics management, SDP personnel will:

- 1. Store contraceptives at the SDP level following accepted storage guidelines.
- 2. Make entries into the Day-to-Day Form and Inventory Record in an accurate and timely manner.
- 3. Work with the District MCH Coordinator to complete monthly reports and determine contraceptive needs.
- 4. Conduct a physical inventory of contraceptives stored at the SDP on a monthly basis."

SDP Storage

Only 1 out of 16 persons interviewed could list the major storage guidelines, however 10 of the 16 storerooms (62%) visited were maintained according to the guidelines for good storage.

From these results it appears that the district level staff that have visited their SDPs since training have not put much emphasis on naming the storage guidelines specifically, but there is evidence in many locations that they have worked with SDP staff to improve general storage conditions when compared to the storage conditions observed during the training needs assessment visits.

SDP Record Keeping

100% of SDPs visited maintain Day-to-Day Books with an 86% accuracy rate.

100% of SDPs visited maintain Inventory Records with a 63% accuracy rate.

All SDP personnel interviewed were recording client visits in Day-to-Day Books and keeping track of contraceptive supplies in Inventory Records. Fifty percent of SDP personnel interviewed had attended HMIS training during which participants are taught how to use these forms. District MCH Coordinators are also responsible for ensuring that SDP personnel know how to accurately complete these forms. The evaluators were encouraged by this level of use.

While 100% of SDPs were completing the Day-to-Day form, none were completing Summary Table 3, a form used to aggregate the quantity of contraceptives dispensed to users on a monthly basis. This is because none of the SDPs had been given Summary Table 3 to complete. While participants in the regional workshops are taught how to complete and use Summary Table 3, the Day-to-Day books distributed by the FPU do not include it. A similar form is found in the HMIS MCH Statistics Book 3 (on page 20), and 38% of SDPs visited were completing this form. All those completing the MCH Statistics Book 3 had attended the HMIS training. The FPU should add Summary Table 3 to the Day-to-Day Books it distributes or distribute the table separately. While use of the form is not absolutely essential to the effective operation of the logistics system, it would assist both SDP and district personnel to organize data that is used in assessing supply status and later reported. The organization of dispensed to user data is a topic which will be strengthened in the revised curriculum.

Most of the problems associated with the use of the Inventory Record related to the recording of minimum and maximum stock levels in absolute numbers rather than in months of supply. When asked about this, SDP personnel said that during HMIS training they were taught to fill in a specific number on the form for these levels and that this might change once logistics training had been done in their region. District personnel had not yet addressed this topic with many of the SDPs.

SDP Reporting & Ordering

11 of the 16 SDPs visited had prepared reports with district level staff or on their own.

It is the responsibility of district level staff to complete the Report & Request for Contraceptives with SDP staff during their monthly supervisory visits. Since 12 of the

16 SDPs visited had received at least one supervisory visit in the six months prior to the interview, it appears that district personnel are undertaking this responsibility if they are doing their visits.

The quality of the reports seen was generally good. The quantities issued, which at this level is equivalent to dispensed to user data, was accurate in 9 of the 11 sets of reports examined when compared with the Day-to-Day books and Inventory Records.

As at other levels in the system, the majority of orders on the Report & Request for Contraceptives were not based on a calculation of maximum quantity needed, but were based on the providers intuition of how much might be needed. As most SDPs did not initiate the new logistics system until January 1, 1995, SDP staff said that they were not able to calculate the orders at the time of the interviews in late May and early June because they did not as yet have six months data to determine the average monthly consumption.

On a positive note, at least one SDP visited had received effective on-the-job training from the district MCH coordinator and was completing the report entirely on its own, and with the exception of calculating the order, was doing so with close to 100% accuracy.

SDP Physical Inventory

56% of SDP staff knew to conduct physical inventories monthly.
56% had recorded monthly physical inventories in the Inventory Record.

Based on these findings, the majority of SDPs that had received a supervisory visit were conducting regular physical inventories.

Evaluation Objective 3:

To identify areas of the curriculum that could be strengthened as a result of the evaluation findings.

The specific changes that should be made in the curriculum are detailed in the first recommendation presented in this report.

Tanzania Logistics Improvement Project Evaluation Strategy

ANNEX B

TANZANIA LOGISTICS MANAGEMENT IMPROVEMENT PROJECT EVALUATION STRATEGY

BACKGROUND

Since 1992, the FPLM Project has been providing assistance in logistics management to the Family Planing Unit (FPU) of the National Family Planning Programme and to the National AIDS Control Programme (NACP). This assistance has focused on the development of a comprehensive logistics system and the training of personnel at the central, regional and district level to implement the system. Since October 1993, this assistance has been provided under a delivery order agreement with USAID/Tanzania.

As the final activity under its agreement with USAID/Tanzania, FPLM will conduct a midterm evaluation of the Logistics Management Improvement Project. This evaluation will be conducted in two components:

- evaluation of the impact of logistics interventions on the logistics system
- evaluation the effectiveness of the training component.

As the implementation of the improved logistics system is dependent on the training of personnel who operate the system, the two evaluation components are intricately connected. The results of the training evaluation will provide insights into the effectiveness of the training to change job performance, and when compared with the results of the system evaluation, will point to strengths and weaknesses of the training to make systematic changes. The results of the system evaluation will focus on the impact of a number of interventions undertaken over the last three years to improve the logistics system. The results of the system evaluation will show how suitable the logistics system is for Tanzania, and when analyzed against the training evaluation, may point out obstacles to implementation which can not be addressed through training.

Donald Kirkpatrick's four-level model for training evaluation will provide the framework for the evaluation. These four levels include:

- I. Reaction participants opinions regarding training
- II. Learning skills & knowledge achieved during training
- III. Behavior changes in on-the-job performance after training
- IV. Results positive effects of training on the program

Levels I & II, Reaction and Learning respectively, were assessed at the conclusion of each training workshop and will be assessed again during the training evaluation to determine the usefulness of the training and retention of knowledge and skills now that participants have had the opportunity to use them in their workplace. The training evaluation will also focus on Level III, Behavior, to determine if participants are using what they learned in the training, the

key to implementation of the improved logistics system. The systems evaluation will address Level IV, Results, measuring changes in the logistics system that result from the training as well as changes that result from improvements in the system design.

OVERVIEW OF TRAINING EVALUATION

Training under the Logistics Management Improvement Project began in April 1994 with a workshop for central level FPU, NACP, USAID, and UNFPA staff. The purpose of the workshop was to orient participants to the design of the family planning and AIDS control logistics systems and to gain their input into system specifications. The logistics training team from the local institution chosen to conduct regional and district level training, IDM, also attended the central level workshop and received Training of Trainers and Curriculum Development training following the Central Level Workshop.

The first regional level logistics management training was conducted in September 1994. Since then six additional regions have received the logistics management training conducted by IDM. At the time of the evaluation, at least 6 months will have passed since the first 4 regions were trained. The training evaluation will be conducted in 4 regions (Dodoma, Morogoro, Mbeya and Iringa) as sufficient time will have passed for each region to have placed at least 1, if not 2, quarterly supply orders, one of the procedures introduced in the training. A sample of districts and service delivery points will be visited in each of the 4 regions.

The evaluation of training activities at the regional level and below will assess how much participants learned from the training and what they are practicing on the job as a result of the training. Specifically the training evaluation will:

- determine if the training program is accomplishing its objectives
- identify the strengths and weaknesses of the training strategy and curriculum
- determine if the right people benefited
- identify which participants benefitted most and least, who may require retraining
- reinforce major points made in the training
- determine what non-training factors may be influencing job performance

Working in two teams, FPLM Training Advisors Barbara Felling and Daniel Thompson, two IDM trainers, and two representatives from the FPU, USAID, and/or UNFPA, will conduct the regional/district level evaluation using interview, observation and testing to gather data. As a baseline, it is assumed that participants had no pre-requisite knowledge or skills to implement the improved logistics system before training.

The FPLM Training Advisors will also interview central level FPU and NACP personnel and the IDM Training Team to determine the effectiveness of the management of the training process and of the training strategy, in general.

25

OVERVIEW OF THE SYSTEMS IMPACT EVALUATION

Technical assistance in logistics management has been provided to the National Family Planning Programme and the National AIDS Control Programme since February 1992. The first two years of assistance focused on the design of an improved logistics system and included the development of a logistics management information system, an inventory control system, a driver scheduling and transportation plan, establishment of central warehousing procedures, and on-the-job and formal training of central level staff. The general purpose of the logistics system evaluation is to determine the impact of these interventions - are contraceptive and AIDS control supplies flowing better from the central level to service delivery points than they were prior to the interventions? It will also assess if specifications of the system are appropriate for Tanzania and what changes or modifications might be needed. In addition, the system impact evaluation will point out how well the training activities have enabled NFPP and NACP staff to implement the improved system. Specifically, the systems evaluation will look at details of the

- 1. logistics management information system
- 2. inventory control system
- 3. storage capacity and conditions
- 4. distribution scheduling and transport plan
- 5. logistics system management structure

The 1992 assessment of transport and storage and the pre-training needs assessments will form a baseline for comparison to the current effectiveness of the system. The systems evaluation will be conducted by FPLM Logistics Advisor Steve Perry and Consultant Cliff Olson. It will be conducted in 4 regions, two of which will have received logistics management training, two of which will have not. Observation and interview will be used to gather data.

Training Evaluation Interview Questionnaire

TANZANIA TRAINING EVALUATION INTERVIEW QUESTIONNAIRE

Introduce yourself. Explain to the person you are interviewing that you are gathering information about how well the logistics training has helped him/her in managing family planning/condom supplies. Explain that you would like to ask him/her a few questions and to look at the records, reports and storage area. Ask that the records and reports be made available to you to review.

	wrong answer		
31.	How do you place an emergency order?		
	You complete a Report & Request for Contraceptives/Supplies form as you would for a routine order and write the words "EMERGENCY OR at the top. If possible, call or fax the order in ahead of the order form.	DER"	
	wrong answer		
STOF	RAGE		
32.	What is the shelf life of condoms? 5 years wrong answer		
33.	What is the shelf life of the IUD Copper T-380A? 7 years wrong answer	· .	
34.	Name the ten storage guidelines.		
	Clean store regularly.		
	Store contraceptives in dry place out of direct sunlight.		
	Secure store from water damage.		
	Assure fire equipment is available.		
	Store condoms away from electric motors and florescent lights.		
	Stack contraceptives 10 cms from floor and no more than 2.5 meters high.		
	Arrange cartons/boxes so as to see expiry dates		
	Store contraceptives to follow FEFO		
	Store contraceptives separate from insecticides, chemicals, petrol, etc.		
	Separate and dispose of expired contraceptives.		
	Other		

A A CA

35. Interviewer, observe storage area against the following guidelines:

GUIDELINE	YES	NO
a. Storage area is clean.		
b. Cartons/boxes have been placed to avoid existing or possible water damage.		
c. Contraceptives stored out of direct sunlight.		
d. Condoms are stored away from electric motors and florescent lights.		
e. Commodities are at least 10 cms from floor (4 inches).		
f. Commodities are stacked no higher than 2.5 meters (8 feet)		
g. Cartons and boxes are clearly marked with expiry dates.		
h. Commodities are arranged to follow FEFO.		
i. Commodities are stored away from insecticides, chemicals, old files, office supplies, etc.		
j. Expired/damaged commodities have been separated from usable stock.		
k. Expired/damaged stock has been marked as unusable.		

MONITORING & SUPERVISION

36.	What are the essential logistics-related supervisor	ry activities	that you learned i	n traini	ing?
	Review all records/reports			4	- '
	Check if storage guidelines are being followed				
	Provide on-the-job training as needed				
	Other answer given				
For N	FPP district level only. Skip to question XX if	other.			
37a.	Are you able to visit all the SDPs you supervise	every month	? Yes 🗖	No	
b.	If no, how many are you able to visit?				
	more than half of the SDPs exactly half	les	s than half 🗖		

Ask at SDP and district levels: 38. How many visits has your supervisor made in the last 5 months (Morogon).

26-4-95	Chalangwa		2000		10,500	
28-4-95	Kiwira		1500		9000	

The SDPs in this district have dispensed the following amounts of condoms in the last six months:

Total Condoms Dispensed in District

October	4567
November	4325
December	4876
January	4123
February	5111
March	4712

INSTRUCTIONS

Calculate the number of months of supply of condoms in Mambo District facility on 28 April 1995.

TANZANIA TRAINING EVALUATION DISTRICT EXERCISE 1 ANSWER SHEET

Months of Supply = Stock on Hand ÷ Average monthly consumption rate (AMCR)

- 1. In the exercise, the stock on hand on 28 April 1995 is 9000 pieces of condoms.
- 2. The average monthly consumption rate is

Total Condoms Dispensed in District

October	4567	
November	4325	
December	4876	
January	4123	
February	5111	
March	<u>4712</u>	
	27,714 ÷	6 = 4619

A six month average is used to calculate the AMCR because there is no increasing or decreasing trend noted.

3. Months of Supply of Condoms = $9000 \div 4619 = 1.9$ months of supply of condoms

1.1

TANZANIA TRAINING EVALUATION REGIONAL EXERCISE 1

The SDPs in all the districts in Mbeye Region have dispensed the following amounts of condoms in the last six months:

Total Condoms Dispensed in Region

October	24,567
November	24,325
December	24,876
January	24,123
February	25,111
March	24,712

INSTRUCTIONS

Calculate the number of months of supply of condoms in Mbeye Region on 17 April 1995.

TANZANIA TRAINING EVALUATION REGIONAL EXERCISE 1 ANSWER SHEET

Months of Supply = Stock on Hand ÷ Average monthly consumption rate (AMCR)

- 1. In the exercise, the stock on hand on 17 April 1995 is 60,000 pieces of condoms.
- 2. The average monthly consumption rate is

Total Condoms Dispensed in Region

October	24,567	
November	24,325	
December	24,876	
January	24,123	
February	25,111	
March	<u> 24.712</u>	
	147,714 ÷	6 = 24,619

A six month average is used to calculate the AMCR because there is no increasing or decreasing trend noted.

3. Months of Supply of Condoms = 60,000 ÷ 24,619 = 2.4 months of supply of condoms
